

Linux Commands

- ls – To list all the commands
- pwd – To know present working directory
- mkdir – To make a directory (Here directory is nothing but a folder)
- cd – To change the directory
- rmdir – To remove a directory
- touch – used to create file.
- ls -l – To list files and directories in the current working directory in **long format**.
- Mv – To move files from one directory to another and we can change the name of the file by using this command.
- Cd .. – To move one step back.
- Clear – It is used to clear the screen
- Cat - In Linux, the **cat** command is a core utility used primarily to **read, create, and concatenate** text files.
- Cat > filename – To write the content in the file
- Cat >> filename – To append the content to a file
- Nano – It is the name of the file editor
- echo – Is used to print whatever line we give
- date – is used to print current date

⇒ echo Today's date is \$(date)

here \$(date) is used to print date after that sentence. If you don't want that be printed in a sentence then you can just give date command it will give current date.

⇒ If you want to use a command inside a command then you give \$() after first command and you have to place second command in ().

⇒ Echo now the time is \$(date +%T) .Here \$(date +%T) is used to print the time without time
